DETAILED ACTION
EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Applicant's Attorney on June 20, 2008.

Please amend the following claims accordingly:

- ***Please cancel Claim 8.***
- ***Claim 9***, On page 5, starting at line 6, insert ***"means for determining a difference between a maximum load and a share of the load due to the transmission over the first channel;"***
- ***Claim 10***, On page 5, starting at line 19, insert ***"means for determining a difference between a maximum load and a share of the load due to the transmission over the first channel;"***

Allowable Subject Matter

The following is an examiner's statement of reasons for allowance:

Regarding independent ***claims 1 and 8-9***, among the cited prior art, the following is the closest prior art relevant to the claimed invention:

a.) European Patent Publication Number: EP 1 237 296 A2, hereinafter disclosed as "Hamabe et al." –
Mobile Communication System, Transmission Power Control Method therefore, and Base Station used therefore

The claimed invention relates to transmitting data over first and second channels, the first channels having a predefined grade of service and the second channels having a variable grade of service whereby the system is capable of determining a share of the load which is due to the transmission over the first channels by subtracting the share of the load which is due to the transmission over the second channels from the actual load of the transmit power amplifier.

Hamabe et al. determines the share of the load by using the difference between a maximum load and the share of the load which is due to the transmission over the first channels, and controlling the transmission over the second channels on the basis of the said difference.

However, in contrast with distinctly comparable differences Hamabe et al. fails to clearly disclose the claimed invention by disclosing a method whereby a controller determines the transmission power for the shared channel according to the transmission power of the dedicated channels, so that a sum of transmission powers for the shared channel and for the dedicated channels are maintained ***constant***, while in

the present invention, the power will adjust to the difference between a maximum load and the share of the load which is due to transmission over the first channels. In this way, the power is shared between the first channels and the second channels keeping the power in the first channel at the proper level to maintain the predefined grade while allowing the grade to vary in the second channel. In addition, Hamabe et al. teaches that the transmission power of the dedicated channels are monitored or measured. In contrast, the present invention discloses a share of the load which is due to the transmission over the first channels is calculated by subtracting the share of the load which is due to the transmission over the second channels from the actual load.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should.
